HUYGENS 96: resultats de març-abril 2012

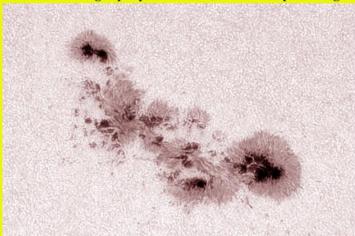

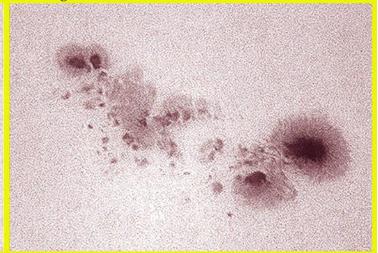

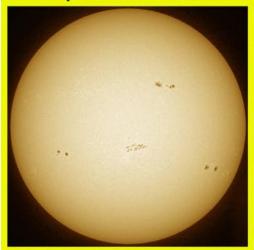

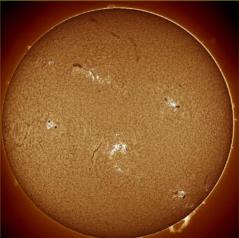

El 3 de març amaneix pel limbe del nordest un fort grup de taques solars compacte amb una singularitat que li va fer sorprendre als observadors, ja que una sola penumbra envoltava a la pròpia configuració bipolar magnètica, es tracta d'un grup tipus "delta", desenvolupant fulguracions de gran intensitat els dies 3 al 7 a les fotos de dalt.

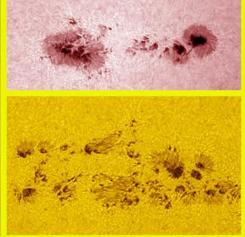

A mesura que avançava cap al meridià central, les diferents tempestes solars van crear ponts de llum als diferents nuclis els dies 8 i 9 de març, prenent l'aspecte bipolar amb nuclis i penumbres ben formades. Aquest grup va ser numerat pel NOAA com el 11429. Totes les fotografies les va fer Pepe Manteca amb càmera DMK 41 i (R)128mm.

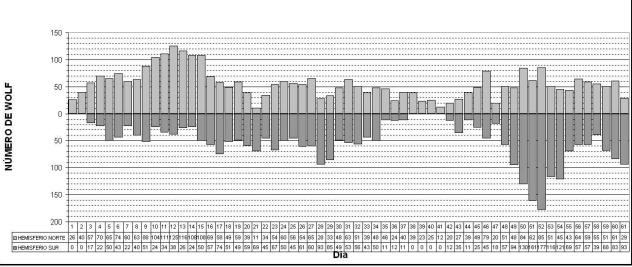

El 21 d'abril, l'activitat solar assolia valors força elevats, propers al d'un màxim undecenal i amb clar predomini de l'hemisferi sud. La imatge de l'esquerra està feta per Juan Pedro Mesas Plaza, a la fotosfera i la de la dreta a la cromosfera per José Muñoz Reales. Les de les taques de la dreta, del meridià central per P. Manteca i J. Ruiz.

NÚMERO DE WOLF DIARI PER HEMISFERIS DURANT MARÇ-ABRIL 2012
